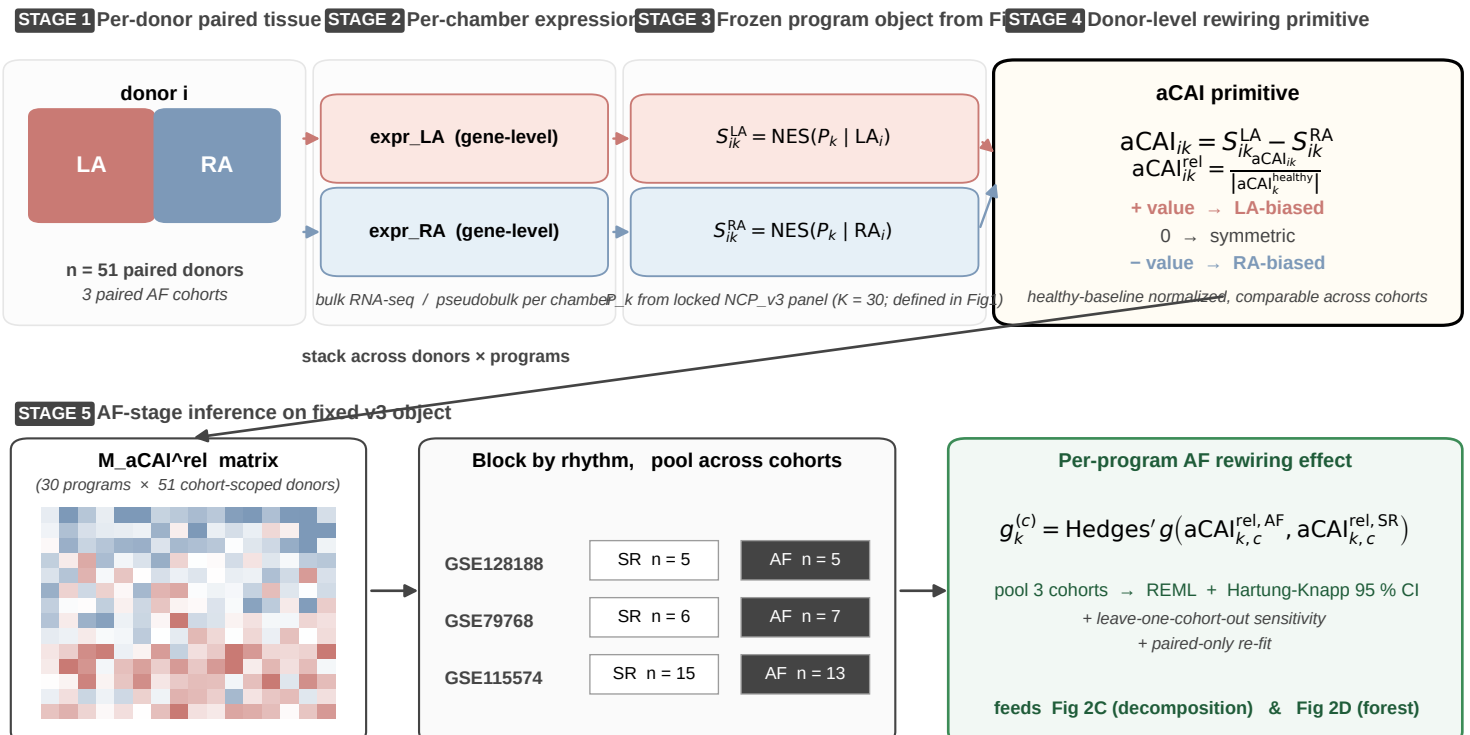

Fig 2A Fig1->Fig2 bridge: frozen v3 panel to AF rewiring unit

No panel re-selection in Fig2: v3 programs are fixed from Fig1, then projected to donor-paired AF cohorts for rewiring estimation.

Notation: i = donor; k = NCP_v3 program; c = cohort; P_k = program gene set; expr = per-gene expression vector.
All inference is on aCAI, never on raw chamber expression — this controls for donor batch and bulk composition while preserving sign and magnitude of chamber asymmetry.
