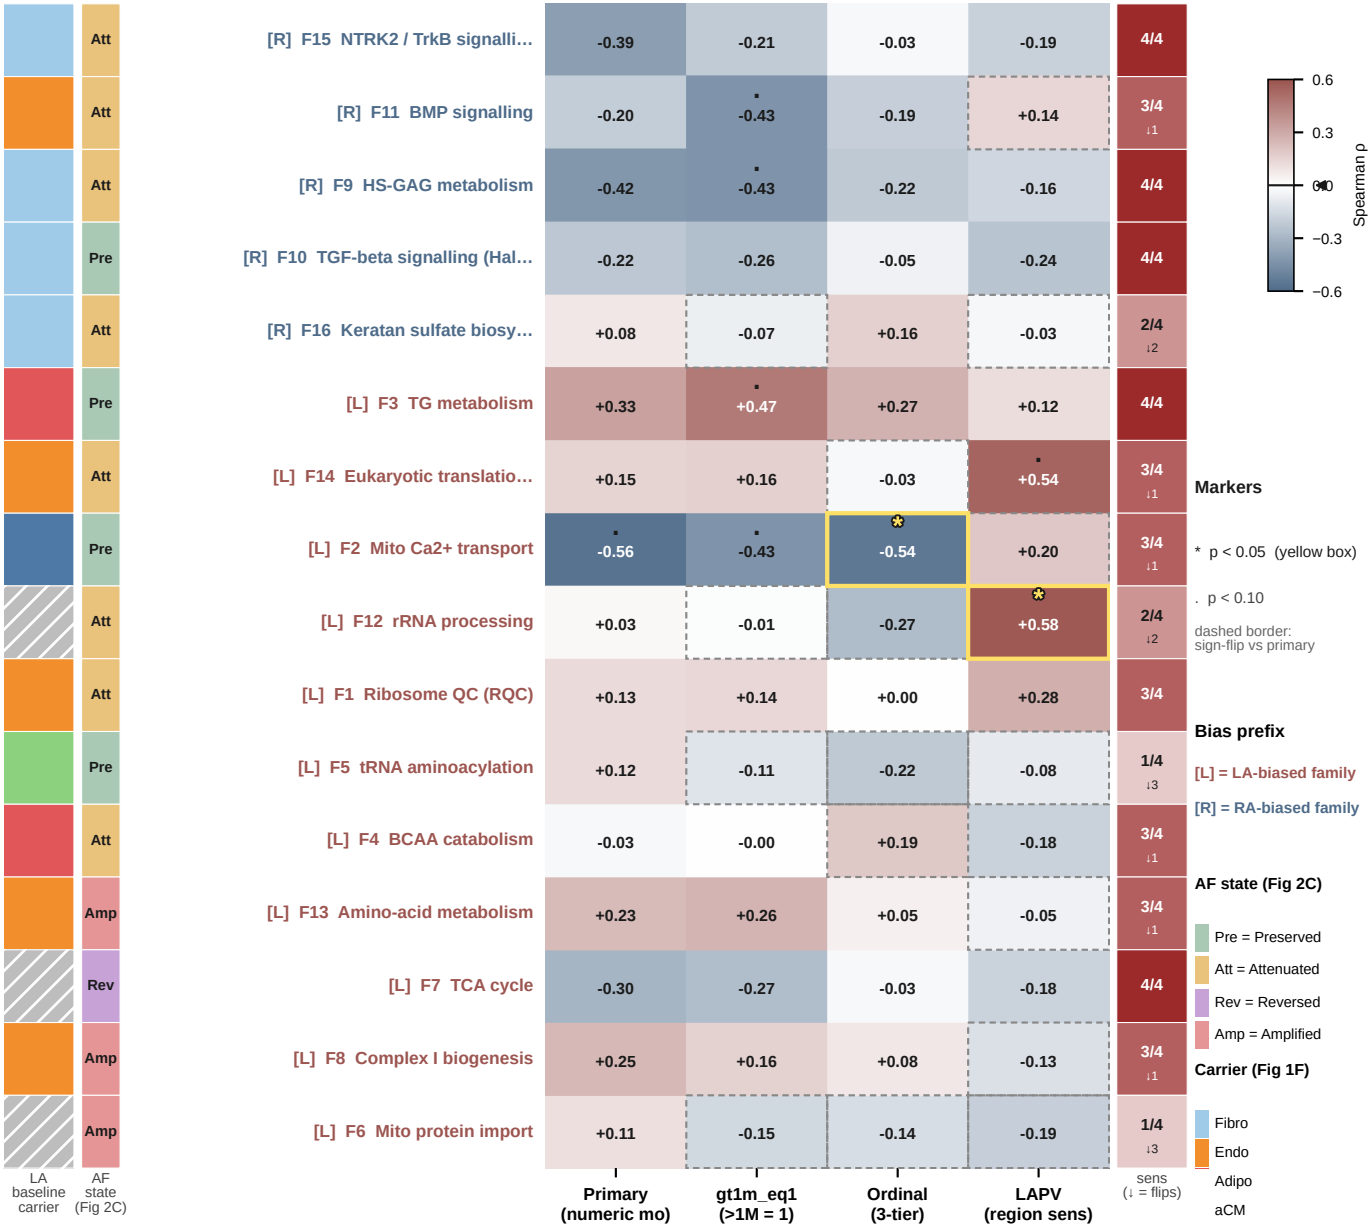

Fig 4b Family-level Spearman ρ vs AF duration across 4 sensitivity codings (GSE41177 LAA + LAPV)

Spearman ρ vs AF duration (months), n = 12. * p < 0.05, . p < 0.10 (10,000 donor permutations). Right: same-sign concordance (/4 sensitivity codings); ↓ = number of codings flipping sign vs primary.

Row order: atlas PriorityScore descending (cross-figure consistency with Fig 3b). Family bias is encoded as [L] / [R] prefix in the family label; carrier strip = HCA baseline (Fig 1F); state strip = Fig 2C conse

Caveats: (i) F15 ρ = -0.385 in primary (rounded -0.39 < 0.4 → Weak-trend, NOT Strong-trend). (ii) F11 BMP gt1m_eq1 ρ = -0.43 (p<0.05) but primary ρ = -0.20 (NS) -- single-coding sig is not robust here.

(iii) F3 TG metabolism shows 4/4 concordant positive ρ (lipid metabolic adaptation strengthening with chronicity, distinct from F9/F15 attenuation).
