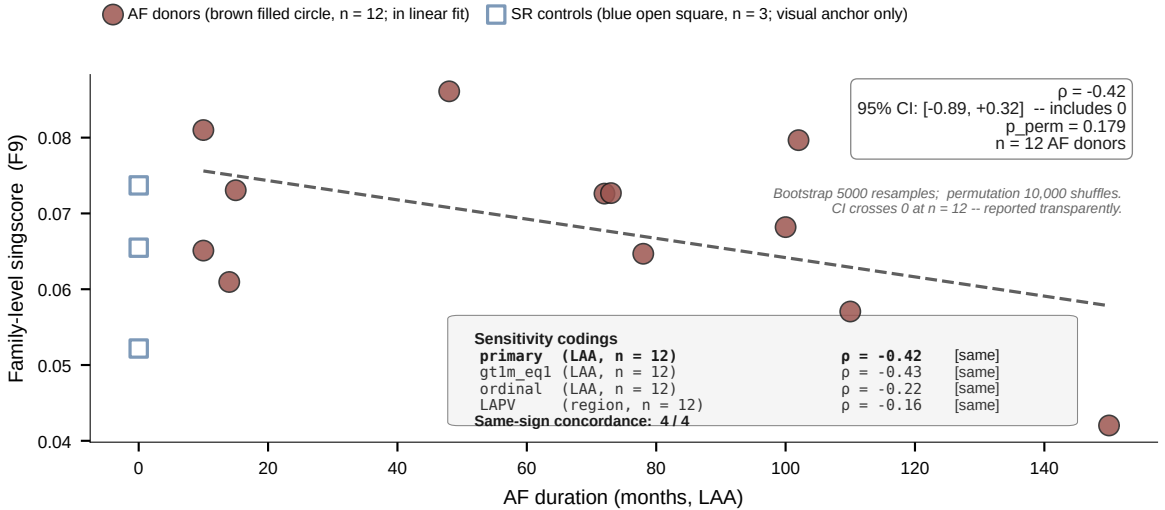
Fig 4d F9 HS-GAG metabolism — Strong-trend (4/4 sensitivity)

Strong-trend (4/4 sensitivity)



GSE41177 LAA bulk RNA-seq. AF n = 12 donors with numeric duration; SR n = 3 (anchor only). Linear fit shown for visualisation only; ρ is rank-based. LAPV sensitivity row uses the paired LAPV-region cohort (n = 12), not LAA-pooled.

Data:

F9 (Heparan / Glycosaminoglycan metabolism, RA-biased baseline) shows a robust negative duration association (ρ = -0.42, 4/4 sensitivity concordance, all four codings same-sign).

Biology:

HS-GAG biosynthetic / catabolic activity declines with AF duration in LAA, compatible with progressive depletion / saturation of stromal proteoglycan turnover during chronic AF.
