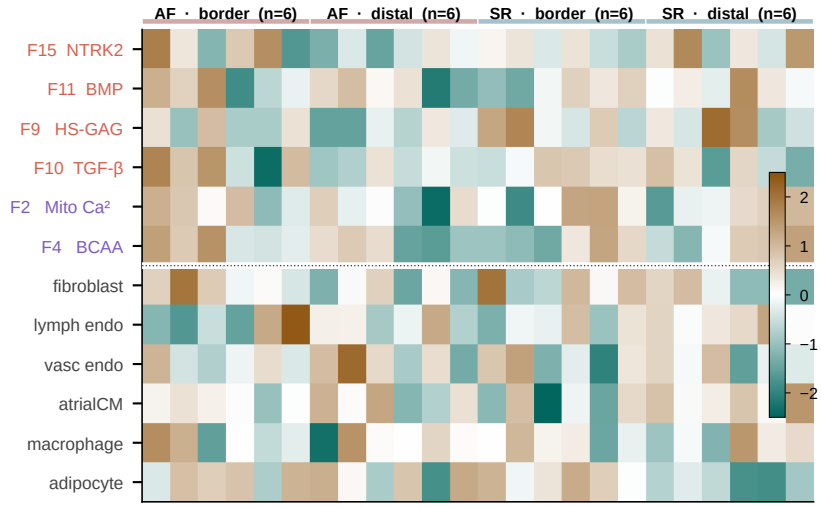
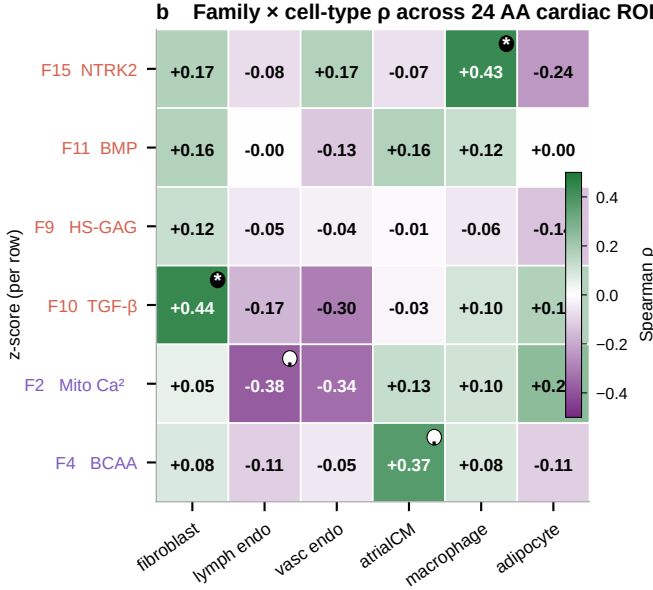
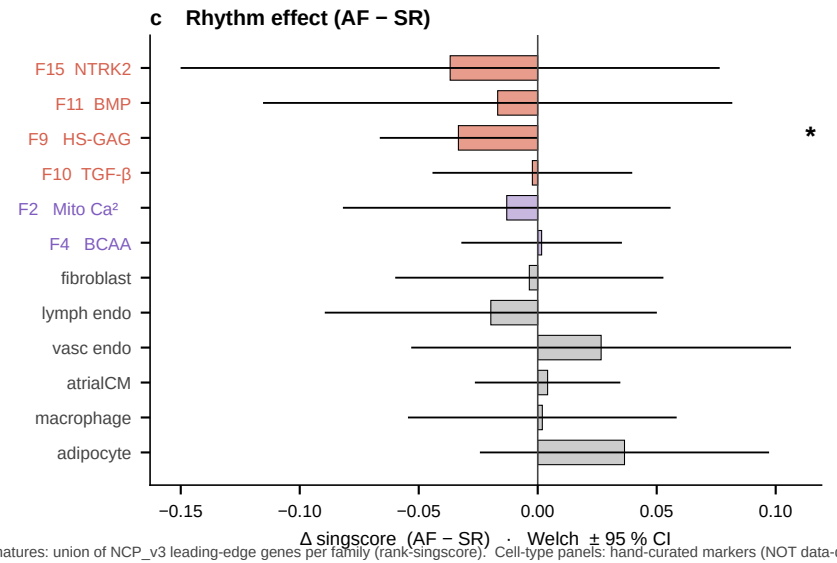
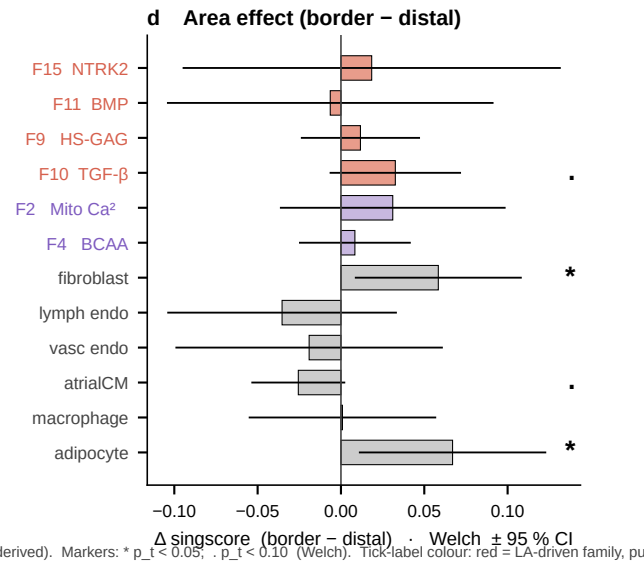
Fig 5d v3 GeoMx AA ROI spatial corroboration (n = 24 cardiac DNA+ ROIs)

6 NCP_v3 priority families (rank-singscore on LE union) + 6 canonical cell-type marker panels. Spatial layer is corroboration only; mechanistic causality is NOT inferred from 5d.









Family signatures: union of NCP_v3 leading-edge genes per family (rank-singscore). Cell-type panels: hand-curated markers (NOT data-derived). Markers: * p_t < 0.05, . p_t < 0.10 (Welch). Tick-label colour: red = LA-driven family, pu

Family selection rationale: F15/F11/F9/F10 = atlas Triple-/Double-/Single-positive (***); F2 = Strong-trend duration (Bilateral *); F4 = Adipo-carrier metabolic (Bilateral *) for Fig 3F sub-family link.
