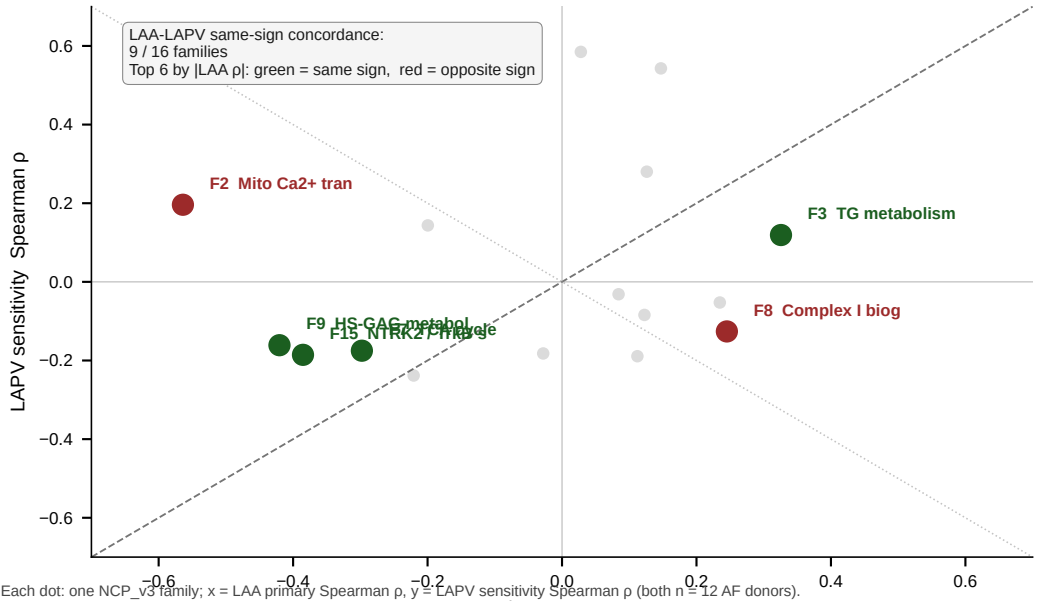
Fig S4b LAA vs LAPV duration-trend concordance (GSE41177)



Each dot: one NCP_v3 family; x = LAA primary Spearman ρ, y = LAPV sensitivity Spearman ρ (both n = 12 AF donors). Solid diagonal y = x marks perfect LAA-LAPV agreement; dotted antidiagonal y = −x marks perfect inversion.

At n = 12 the LAPV per-family ρ is highly uncertain (bootstrap CI is wide, often spanning zero); the only robust statistic at this resolution is the LAA-LAPV same-sign concordance count. Individual LAPV ρ values should not be interpreted as independent confirmation of LAA ρ, but as a region sensitivity arm only.

Top 6 by |LAA ρ| are highlighted: green dots = LAA and LAPV same direction; red dots = opposite direction.
