S8 Specificity / falsification of the chamber-aware rewiring framework

S8a — size-matched random gene-set permutations

S8b — axis-membership permutation (B = 1000)

S8c — real frozen support programs vs pre-registered negative controls

S8d — leave-one-program-out (LOPO) axis robustness

Pre-registered controls (FIGURE_S8_FALSIFICATION_SPEC.md): A) size-matched random gene sets · B) axis-membership permutation · C) six negative-control pathways (axis-specificity vs unrelated) · D) leave-one-program-out (LOPO) — both axes remain direction-preserved.
